                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for comparing one or more nucleic acid targets within two or more samples. The method comprises preparing a sample mixture by obtaining at least a first sample and a second sample, each potentially with at least a first nucleic acid target and mixing the first nucleic acid sample and the second nucleic acid sample to create a sample mixture. The method of the invention is useful for fractionating nucleic acid samples into target fractions then using nucleic acid samplies into target seem the nucleic acid target within each fraction. This method as compared to prior art methods facilitates the analysis of more target sequences to determine nucleic acid profiles of limited tissue samples. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABS63332 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                31-JAN-2002; 2002WO-US003169

                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method of quantifying in vivo RNA from CC abiological sample. This involves collecting the biological sample in a C tube comprising a compound inhibiting RNA degradation and/or gene in a CC induction, forming a precipitate comprising nucleic acids, separating the CC precipitate from the supernatant, dissolving the precipitate using a CC buffer, forming a suspension, isolating nucleic acids from the supension cC using an automated device, dispersing or distributing a reagent mix for reverse transcription (RT)-PCR using an automated device, dispersing or distributing a reagent mix for constraints using the nucleic acids isolated within the dispersed reagent mix cC using an automated device and determining the in vivo levels of transcripts using the nucleic acid and RT-PCR reagent mix of the previous step in an automated setup. The method is useful for monitoring or cesent, such as eukaryotic or prokaryotic cells, viruses or phages in a biological sample or for producing a medicament for treating immune crelated disease, e.g., autoimmunity, rheumatoid arthritis, multiple sclerosis, cancer, immunodeficiencies such as AIDS, allergy, grafit cc primer/probe used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cc junctions of genes encoding a polypeptide associated with lung and/or cnasal airway dysfunction and a second active agent comprising an extra control and ubiquinone. A composition of the invention cc antiinflammatory, antiallergic, antiasthmatic, hypotensive, thas antiinflammatory, antiallergic, antiasthmatic, hypotensive, composition and the properties of the composition is useful for treating or use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also containflammatory steroid in a subject, for reducing or depleting levels of an antiinflammatory steroid in a subject, for reducing or depleting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine continuity surfactant in a subject, stissue, or treating bronchocomstriction, consisted inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO cat figure is a subject, sequences.

ce expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.

C The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiaflammatory, antiasthmatic, and beta-adrenergic agonist. The composition is useful for preventing or threating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasconstratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation reppiration, respiration, respiration, reppiration, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system c.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

                                                                                                                                                                                                                                                                                                                                                                     . 8
                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences given in AAT50760-69 are primers which were used to amplify CC the sequences encoding ovine interleukin-5 (II-5), and interleukin-12 (II-CC -12) 35 kD subunit (partial and full length sequence) and the 40 kD CC subunit. Ovine II-5 or II-12 are used to treat and/or prevent infections CC in livestock (esp. cows and sheep), particularly where the animals are CC stressed, e.g. during transport. II-5 and II-12 can also be used as CC adjuvants in vaccines for veterinary use (partic. weakly immunogenic CC subunit or synthetic peptide vaccines). They may also be used to treat CC cancer, immunosuppression and allergy, to enhance/suppress the CC reproductive system and to promote growth or early maturity. Optionally CC interleukin can be delivered from constructs or delivery cells and CC antibodies are useful in enzyme immunopotentiators, especially II-5 CC promotes growth of early haematopoietic progenitor cells and generation of constructs growth of early haematopoietic progenitor cells and generation of constructs or delivery cells and generation of gamma-interferon by, and proliferation of, T and NK cells and increases the (non-)specific cytolytic lymphocyte response. The genetic constructs can also be used for in vitro production of II-5 or -

The present sequence is an antisense oligonucleotide HUMIISAS7 specific for the human II5. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary disease, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine-induced bronchoconstriction in patients with hyper-reactive airways
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for treating airway disease in a subject has been produced which involves the topical administration of an essentially adenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 5;

                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes antisense oligonucleotides (AAX52869-X55271) CC directed against at least 2 mRNAs selected from target genes, coding and conon-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung ciseases, pulmonary vasoconstriction, inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, respiratory diseases, pulmonary vasoconstriction, impeded respiration, respiratory, culmonary vasoconstriction, emphysema, chronic obstructive pulmonary colon cancer, pain, cystic fibrosis, pulmonary hypertension, colon cancer, bean cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, carcinomas e.g. colon cancer, breast cancer, but generated cancer, as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The present invention describes a new composition comprising an antisense CC oligonuclectide (ON) with low adenosine (up to 15%), which targets cull carids involved in bronchoconstriction, allergies, and/or cC inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are cuseful for the treatment of diseases associated with inflammation, cC impaired airways, including lung disease and diseases whose secondary ce.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distease syndrome, pain, cystic cibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the CONs reduces side effects. The A-containing ONs break down with the crelations and inflammation. AAA32313 to AAA35312 represent the uncleotide sequences given in the sequence listing from the present the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 cquences given in the disclosure of the present invention do not match corresponding SEQ ID NO:1 to 185, but the sequences differ crom the previously named sequences. SEQ ID NO:1 to 1860 (AAA32333 to AAA32331 to AAA32333 to AAA32331 to AAA32333 to AAA33232 are specifically claimed ONs from the present invention do not match compating the present invention of the present invention of the sequences given in the disclosure of the present invention do not match compating the content of the present invention do not match compating the present invention of the sequence differ content of the present invention of the sequence side of the present invention of the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonuclectides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nyce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 18;

Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Dean
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-MAR-1999;

Oligonucleotides were designed to target nucleic acids encoding II-5 and II-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with II-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to

                                                                                                                                                                                                                  The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (II-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation

                                                                                    The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                        Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and cosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.

Oligonucleotides were designed to target nucleic acids encoding II-5 and II-5 receptor-slipha. The antisense oligonucleotides may be used for the treatment of diseases associated with II-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and cosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay iffertive intervent of the oligonucleotides are also useful for research uses and to

                                                                                                                                                                         of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens.

XX,

Karras JG,

The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (II-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding II-5 and II-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with II-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to

or

delay infection, inflammation or tumour

formation

Claim 4;

Page 63; 156pp; English.

Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.

                                                                                               of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                 Dean

Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to

Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and cosinophilic syndrome. The oligonucleotides are also useful for research uses and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.

                                                                                                The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (II-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding II-5 and II-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with II-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding II-5 and II-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with II-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; interleukin-5; IL-5; signal transduction;

Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and ecsinophilic syndrome. The oligonucleotides are also useful for research uses and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.

humans modulates

compound used to treat asthma and eos

eosinophilic

The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (II-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding II-5 and II-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with II-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation

                                                                                                                                                                                                                                             The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to
                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          02-FEB-2001
                                                                                                                                                                                                                                                                                                                                                                 Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26-MAR-1999;

Oligonucleotides were designed to target nucleic acids encoding II-5 and II-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with II-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to

Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; interleukin-5; IL-5; signal transduction; antisense oligonucleotide; antiasthmatic; immuno IL-5 receptor-alpha; asthma; eosinophilic syndro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human IL-5 antisense oligonucleotide ISIS #16077.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             02-FEB-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAC73692 standard;

                        The present sequence is an oligonuclectide used for antisense modulation of interleukin-5 (IL-5) signal transduction. Oligonuclectides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonuclectides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonuclectides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation

Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; interleukin-5; IL-5; signal transduction; antisense oligonucleotide; antiasthmatic; immunosuppressive; cytostatic; IL-5 receptor-alpha; asthma; eosinophilic syndrome; infection; inflammation; cancer; ss.

Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to
                                                                                                                                                                                       Sequence 20 BP; 4 A; 8 C; 0 G; 8 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                             Antisense oligonucleotide compound used to treat asthma and eosinophilic syndrome in humans modulates interleukin-5 signal transduction.

Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation

                                                                                                           of interleukin-5 (IL-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonucleotides are also useful for research uses and to prevent or delay infection, inflammation or tumour formation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; interleukin-5; IL-5; signal transduction; antisense oligonucleotide; antiasthmatic; immuno
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             syndrome. The oligonucleotides are also useful for prevent or delay infection, inflammation or tumour
                                                                                       Sequence
                                                                                                                                                                                                                                     Antisense oligonucleotide compound used to treat asthma and eos syndrome in humans modulates interleukin-5 signal transduction.

                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                The present sequence is an oligonucleotide used for antisense modulation of interleukin-5 (II-5) signal transduction. Oligonucleotides were designed to target nucleic acids encoding II-5 and II-5 receptor-alpha. The antisense oligonucleotides may be used for the treatment of diseases associated with II-5 signal transduction, II-5 expression or II-5 receptor-alpha expression. Such diseases include asthma and cosinophilic syndrome. The oligonucleotides are also useful for research uses and to
         Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of interleukin-5 (IL-5) signal transduction. Oligonuclectides were designed to target nucleic acids encoding IL-5 and IL-5 receptor-alpha. The antisense oligonuclectides may be used for the treatment of diseases associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor-alpha expression. Such diseases include asthma and eosinophilic syndrome. The oligonuclectides are also useful for research uses and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 7 A; 4 C; 2 G; 7 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nyce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          include are a pharmaceutical composition comprising the antisense oligonuclectide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 roceptor a romodulating the expression of mammalian IL-5 receptor a in mammalian cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction, in-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (DEAN/)

length, which modulates interleukin (IL)-5 signal transcurrent.

C include are a pharmaceutical composition comprising the antisense coligonucleotide and a pharmaceutically acceptable carrier or diluent, and adiagnostic kit for detecting the expression level of the membrane form crass soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of comparts of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian C IL-5 receptor a in mammalian cells or tissues, treating a mammalian C IL-5 receptor a in mammalian cells or tissues, treating a mammalian C IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 113

```
versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 receptor a, in cells or tissues, for altering the expression of mammalian IL-5 receptor a, in cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence
                                                                                                                                                                                                                                                                                                                                       The invention relates to an antisense compound of 8-30 nucleobases i length, which modulates interleukin (In)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent a diagnostic kit for detecting the expression level of the membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       20; Page 19; 77pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, and a diagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian in cells or tissues, for altering the ratio of the isoforms of mammalian in IL-5 receptor a in mammalian cells or tissues, treating a mammalian character with IL-5 signal transduction, IL-5 expression or IL-5 receptor a condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

The invention length, which

relates to modulates :

interleukin an

antisense compound of erleukin (IL)-5 signal

8-30 nucleobases in transduction. Also

The invention relates to an antisense compound of 8-30 nucleobases in length, which modulates interleukin (IL)-5 signal transduction. Also include are a pharmaceutical composition comprising the antisense oligonucleotide and a pharmaceutically acceptable carrier or diluent, a diagnostic kit for detecting the expression level of the membrane f versus soluble form of IL-5 receptor a. The antisense compound is use for modulating IL-5 signal transduction, modulating expression of

diluent, and membrane form and is useful

'n

Novel antisense compound for treating disease/condition e.g. eosinophilic syndrome or asthma associated with interleukin-5 or IL-5 receptor expression or IL-5 signal transduction, modulates IL-5 signal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              include are a pharmaceutical composition comprising the antisense oligonuclectide and a pharmaceutically acceptable carrier or diluent, and adiagnostic kit for detecting the expression level of the membrane form versus soluble form of IL-5 receptor a. The antisense compound is useful for modulating IL-5 signal transduction, modulating expression of mammalian IL-5 or modulating the expression of mammalian IL-5 receptor a for altering the ratio of the isoforms of mammalian IL-5 receptor a in mammalian cells or tissues, for altering the ratio of the isoforms of mammalian IL-5 receptor a mammalian cells or tissues, treating a mammalian having a disease or condition associated with IL-5 signal transduction, IL-5 expression or IL-5 receptor a expression, where the disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                condition include eosinophilic syndrome or asthma. An antisense compound which alters splicing of an RNA encoding IL-5 receptor a is also useful for treating a mammal having a disease or condition. The present sequence is an antisense oligonucleotide targetting human IL5
